Healthy Eating

- Eat a combination of different foods, including staple foods (such as cereals like wheat, barley, rye, maize or rice, or roots such as potato, yam, taro or cassava), legumes (such as lentils and beans), plenty of fresh vegetables, and fruit of various kinds.
- Consume at least 400 grams (i.e., five portions) of fruit and vegetables per day, excluding potatoes, sweet potatoes, cassava and other starchy roots.
- Keep total fat intake to less than 30% of total energy intake to help prevent unhealthy weight gain, ensuring that unsaturated fats (found in fish, avocado, nuts, and sunflower, soybean, canola and olive oils) are consumed rather than saturated fats (found in fatty meat, butter, palm and coconut oil, cream, cheese, ghee and lard) and trans-fats of all kinds.
- Limit sugar intake to less than 10% of total energy intake (ideally below 5%, or roughly 25 grams for an adult), which applies to free sugars added to foods and drinks, as well as sugars naturally present in honey, syrups, fruit juices and fruit juice concentrates.
- Keep salt intake to less than 5 grams per day (equivalent to about one teaspoon) and use iodized salt.

11:11 PM

CheckHER

Blooms Through Every Season of Her Cycle

Exercise Routine

- **Muscle-Strengthening: Incorporate moderate- or greater-intensity muscle-strengthening activities involving all major muscle groups on 2 or more days a week, as these provide additional health benefits.**
- **Older Adults (65+ years): Follow the same aerobic and strength guidelines as younger adults, with an added emphasis on varied, multicomponent physical activity that prioritizes functional balance and strength training on 3 or more days a week to prevent falls.**
- **Children and Adolescents (aged 5–17 years): Average 60 minutes per day of moderate-to-vigorous intensity physical activity, mostly aerobic, across the week. Incorporate vigorous-intensity aerobic activities, as well as those that strengthen muscle and bone, at least 3 days a week.**
- **Limit Sedentary Behavior: Replace sedentary time with physical activity of any intensity, as being physically active helps reduce the detrimental health effects of high levels of sitting.**

11:11 PM

CheckHER

Blooms Through Every Season of Her Cycle

Stress Management

The World Health Organization (WHO) explains that stress is a normal reaction to difficult challenges, but too much of it hurts your health. The WHO recommends these quick steps:

- **Ground yourself: Focus on the present moment when thoughts race.**
- **Unhook from worries: Notice stressful thoughts without letting them control you.**
- **Act on what matters: Let your core values guide your actions, even under pressure.**
- **Be kind to yourself: Practice patience and self-compassion.**
- **Keep daily routines: Stick to consistent sleep, eating, and activity schedules.**
- **Stay connected: Talk to friends and family for support.**
- **Limit media overload: Take breaks from stressful news.**

If stress becomes overwhelming, reach out to trusted a healthcare professional for support.

11:11 PM

CheckHER

Blooms Through Every Season of Her Cycle

Sleep Hygiene

The World Health Organization (WHO) emphasizes sleep as a vital pillar of health, supporting immune function, mental wellness, and cognitive recovery.

Core Principles:

- **Consistency: Maintain fixed wake-up and sleep times to regulate circadian rhythms.**
- **Environment: Keep bedrooms dark, quiet, and comfortable.**
- **Lifestyle: Exercise regularly, avoid caffeine and heavy meals close to bedtime, and limit alcohol and tobacco.**

WHO Sleep Duration Guidelines for Young Children:

- **Newborns (0-3 months): 14 to 17 hours (with safe back-sleeping practices).**
- **Infants (4-11 months): 12 to 16 hours, including naps.**
- **Toddlers (1-2 years): 11 to 14 hours, including naps.**
- **Young Children (3-4 years): 10 to 13 hours, with reduced screen time and active daily play**

11:11 PM

CheckHER

Blooms Through Every Season of Her Cycle

Hydration management

World Health Organization (WHO) hydration management centers on oral rehydration therapy (ORT), categorizing treatment into three distinct clinical plans:

- **Plan A (No Dehydration): Increase fluid intake at home, continue feeding, and administer 10 to 20 mg of elemental zinc daily for 10 to 14 days.**

- **Plan B (Some Dehydration): Administer 75\text{ mL/kg} of low-osmolarity Oral Rehydration Salts (ORS) over a 4-hour period in a healthcare setting.**

- **Plan C (Severe Dehydration): Initiate rapid intravenous fluid resuscitation (Ringer's Lactate) immediately, transitioning to oral ORS (5\text{ mL/kg/hour}) as soon as the patient can drink.**

Weight Management tips

The World Health Organization (WHO) recommends a lifelong approach to weight management focusing on a balanced diet and regular physical activity:

- **Improve Diet Quality: Limit total fat intake to under 30% of total energy, prioritizing unsaturated fats (like plant oils, fish, and nuts) over saturated and trans fats.**

- **Cut Sugars and Salt: Reduce free sugars to less than 10% (ideally under 5%) of daily energy intake and limit sodium.**

- **Increase Plant-Based Foods: Eat at least 400 grams (5 portions) of fruits, vegetables, whole grains, and legumes (lentils, beans) daily.**

- **Stay Physically Active: Adults should aim for at least 150 to 300 minutes of moderate-intensity aerobic activity per week (or equivalent vigorous activity) to prevent unhealthy weight gain.**

- **Reduce Sedentary Time: Limit prolonged sitting and screen time for both adults and children.**

PMOS RISK ASSESSMENT

EMERGENCY SIGNS

Low Risk

The respondent reports few or no symptoms and risk factors associated with hormonal and metabolic reproductive health concerns.

Mild Risk

The respondent reports a limited number of symptoms and risk factors that may indicate emerging hormonal or metabolic reproductive health concerns.

Moderate Risk

The respondent reports multiple symptoms and risk factors associated with hormonal and metabolic reproductive health concerns, suggesting an increased likelihood of underlying reproductive health issues that warrant further clinical assessment.

High Risk

The respondent reports numerous symptoms and risk factors associated with hormonal and metabolic reproductive health concerns, indicating a greater likelihood of significant reproductive health issues.

Note: *The PMOS Health Assessment does not diagnose PMOS. It is intended only for risk identification and health awareness. A moderate- or high-risk result does not confirm PMOS; users are encouraged to consult a qualified healthcare professional for proper assessment and diagnosis.*

SQUAT

SQUAT

A powerful lower body exercise that strengthens your legs and glutes, and improves overall lower body strength.

Targets

Quadriceps, Hamstrings, Glutes.

Benefits

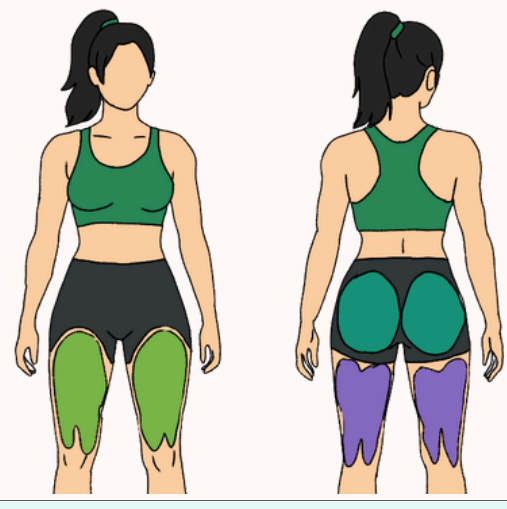

Builds strength, tones muscles, improves posture and balance.

HOW TO DO IT

1. Stand with your feet shoulder-width apart, toes slightly turned out.
2. Lower your hips back and down as if sitting on a chair.
3. Keep your chest up and knees behind your toes.
4. Push through your heels to stand back up.
5. Repeat for the desired number of repetitions.

MUSCLES WORKED

TIPS

- Keep your core tight.
- Don’t let your knees collapse inward.
- Focus on control, not speed.
- Breathe in as you lower your body, breathe out as you stand up.

PUSH UP

PUSH UP

A classic upper body exercise that builds strength in your chest, shoulders, triceps, and core.

Targets

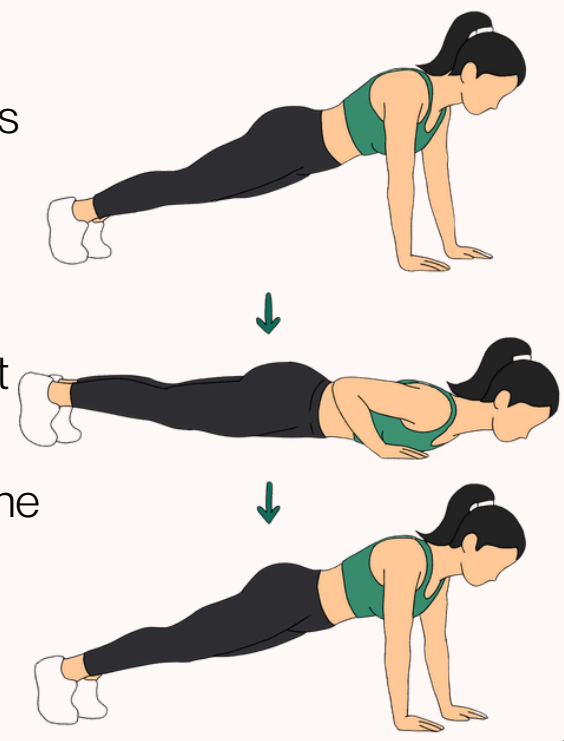

Chest, Shoulders, Triceps, Core

Benefits

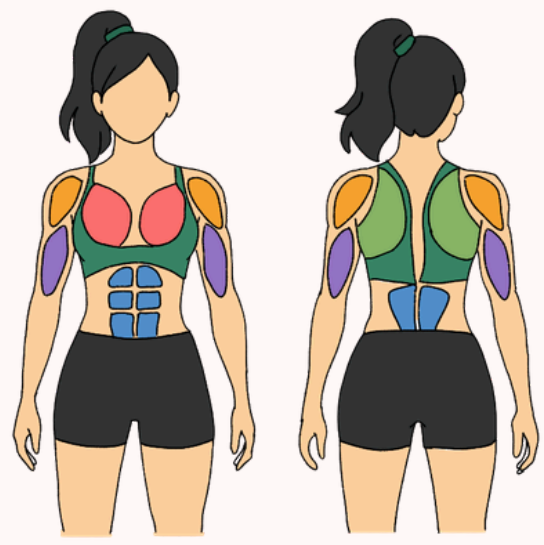

Builds upper body strength, improves core stability and overall endurance.

HOW TO DO IT

1. Start in a plank position with your hands slightly wider than shoulder-width apart.
2. Keep your body in a straight line from head to heels.
3. Lower your body until your chest is just above the floor.
4. Push through your palms to return to the starting position.
5. Repeat for the desired number of repetitions.

MUSCLES WORKED

TIPS

- Keep your core tight.
- Don’t let your hips sag.
- Lower your body with control.
- Breathe in as you lower down, breathe out as you push up.
- Modify on your knees if needed.

DUMBBELL ROW

DUMBBELL ROW

A pulling exercise that strengthens your back muscles and improves posture.
Targets

Targets

Back, Biceps, Rear Shoulders

Benefits

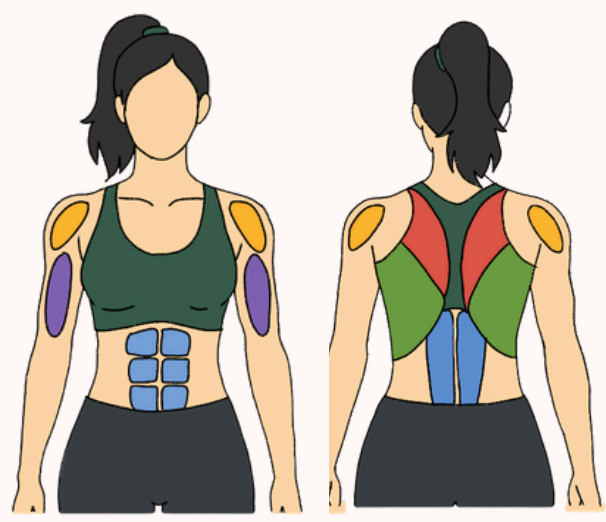

Strengthens your back, improves posture, and reduces back pain.

HOW TO DO IT

1. Place your left hand and knee on a bench.
2. Hold a dumbbell in your right hand with your palm facing your body.
3. Pull the dumbbell up toward your hip, squeezing your back muscles.
4. Slowly lower the dumbbell back to the starting position.
5. Repeat for the desired number of repetitions, then switch sides.

MUSCLES WORKED

TIPS

- Keep your back straight and core engaged.
- Don't twist your torso.
- Pull with your elbow, not your hand.
- Squeeze your back muscles at the top.
- Use a weight that allows good form.

LUNGE

LUNGE

A lower body exercise that strengthens your legs, glutes, and improves balance and stability.

Targets

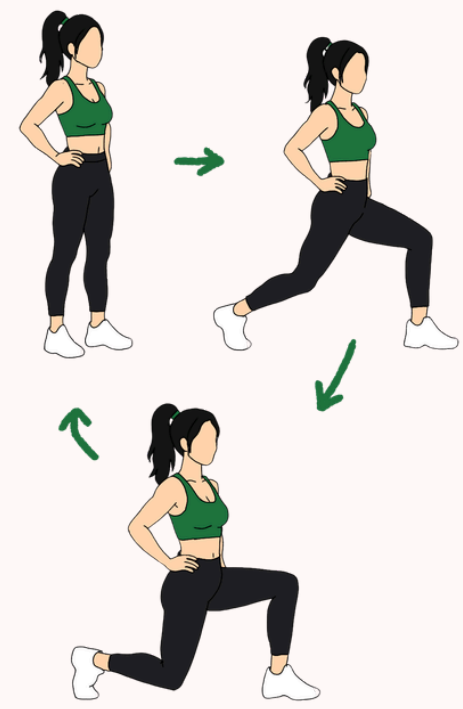

Quadriceps, Hamstrings, Glutes, Calves

Benefits

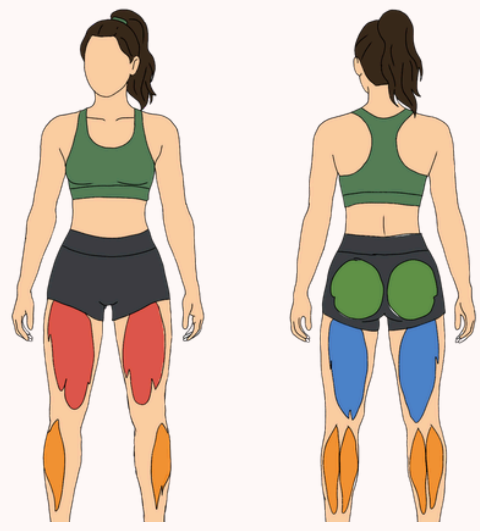

Builds lower body strength, improves balance and stability, and supports functional movement.

Benefits

1. Stand tall with your feet hip-width apart.
2. Step forward with one leg and lower your hips until both knees are bent at about 90 degrees.
3. Push through your front heel to return to the starting position, then switch legs.

MUSCLES WORKED

TIPS

- Keep your torso upright.
- Your front knee should be aligned over your ankle.
- Don't let your front knee pass your toes.
- Engage your core for balance.
- Push through your front heel as you rise.
- Take controlled steps.

DUMBBELL SHOULDER PRESS

DUMBBELL SHOULDER PRESS

An upper body exercise that strengthens your shoulders, upper chest, and triceps.

Targets

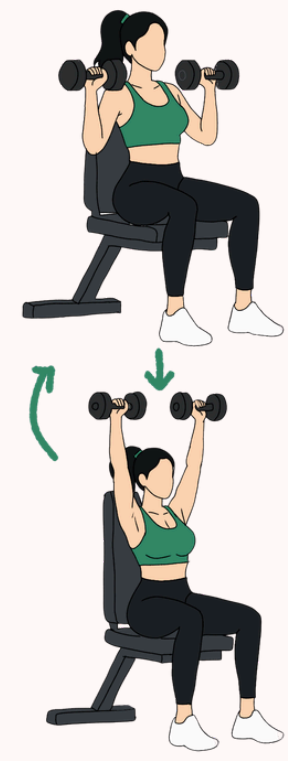

Shoulders, Upper Chest, Triceps

Benefits

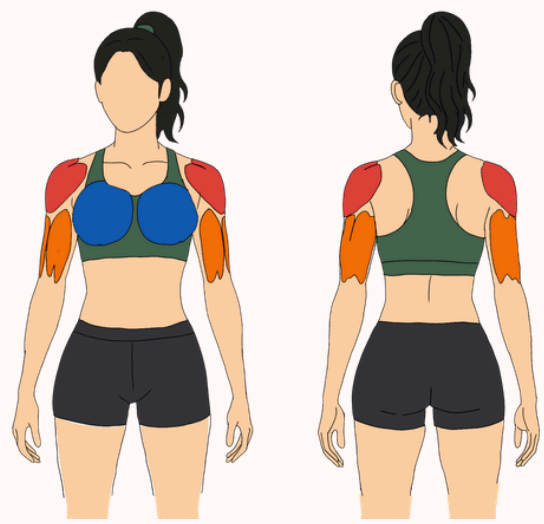

Builds shoulder strength, improves posture, and supports daily upper body movements.

HOW TO DO IT

1. Sit on a bench with back support and hold a dumbbell in each hand at shoulder height.
2. Press the dumbbells overhead until your arms are fully extended.
3. Slowly lower the dumbbells back to shoulder height.

MUSCLES WORKED

TIPS

- Keep your back supported.
- Engage your core.
- Don’t lock your elbows at the top.
- Avoid arching your back.
- Use a weight that challenges you but allows good form.
- Breathe out as you press up, breathe in as you lower down.

Flexibility & Mobility

Flexibility & Mobility

Gentle movements to improve your range of motion, reduce muscle tightness, and support an active, healthy lifestyle.

Benefits

Improves Flexibility
Helps your muscles move more freely.

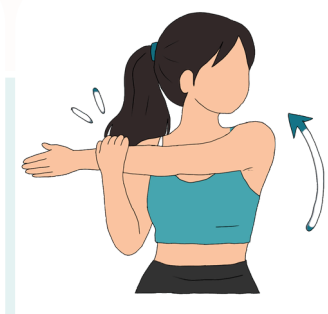

Reduces Muscle Tightness
Helps ease stiffness and discomfort.

Supports Relaxation
Gentle stretching can help you feel calm.

Supports Overall Health
Physical activity contributes to overall well-being.

Neck Stretch
Gently tilt your head to one side. Hold for 15–30 seconds. Repeat on both sides.

Shoulder Stretch
Bring one arm across your chest. Hold for 15–30 seconds. Repeat on both sides.

Hamstring Stretch
Sit with one leg extended and reach toward your toes. Hold for 15–30 seconds.

Butterfly Stretch
Sit with the soles of your feet together and let your knees fall to the sides. Hold for 15–30 seconds.

Remember

Stretch gently, breathe normally, and never force a movement.
Move at your own pace and listen to your body.

Benefits of Exercise

Benefits of Exercise

A healthier you, today and tomorrow.

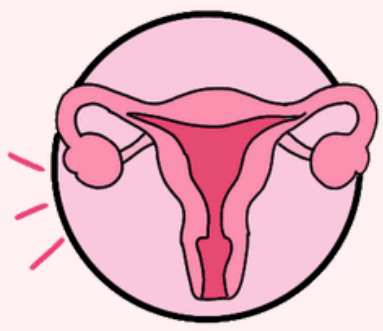

Supports Heart & Metabolic Health

Regular exercise helps improve heart health, blood circulation, and supports healthy blood sugar and cholesterol levels, which may help lower the risk of metabolic problems often associated with PMOS.

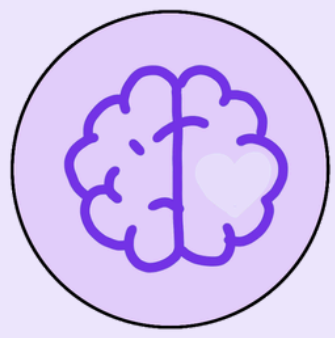

Helps Maintain a Healthy Weight

Physical activity helps manage body weight and body composition, which can support a healthier lifestyle and may reduce weight-related concerns in PMOS.

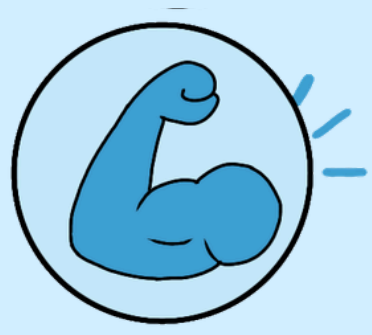

Supports Reproductive and Hormonal Health

Exercise can help improve insulin sensitivity and may support healthy menstrual cycles and overall reproductive health in women at risk for PMOS.

Boosts Mood and Reduces Stress

Regular physical activity can help reduce stress, anxiety, and low mood, and improve overall mental well-being and quality of life.

Builds Stronger Muscles and Bones

Exercise helps increase muscle strength, endurance, and bone density, making everyday activities easier and supporting long-term health.

Warm-up & Cool-down

WARM-UP & COOL-DOWN

Prepare your body, Recover with care.

A proper warm-up prepares your body for exercise, while a cool-down helps your heart rate and breathing gradually return to normal. Both can help you exercise more safely and feel better after your workout.

WARM-UP

Get your body ready

5-10 minutes

Start with light movement

Walk slowly or do gentle movements.

Move your joints

Try gentle arm circles, shoulder rolls, and leg movements.

Gradually increase your movement

Prepare your muscles and heart for exercise.

Why warm-up?

Helps gradually increase heart rate, breathing, muscle temperature, and flexibility.

COOL-DOWN

Slow down gradually

5-10 minutes

Walk slowly

Walk slowly or do gentle movements.

Do gentle stretching

Stretch your muscles without bouncing.

Breathe normally

Allow your heart rate and breathing to return toward normal.

Why cool-down?

Helps your body transition from exercise to rest and supports recovery.

BENEFITS

- Helps prevent injuries
- Supports physical performance
- Reduces muscle soreness
- Helps you feel better after workouts

REMEMBER

Don’t stop suddenly after intense exercise. Give your body time to slow down and recover.
